

Task 2: Excel Analysis – Pivot Tables & Summary Insights

This document explains, step by step, how Task 2 was completed by strictly following the given mini guide and requirements.

Step-by-Step Explanation

- The dataset was first reviewed to ensure there were no obvious issues such as non-numeric sales values or inconsistent column names. This ensured the data was ready for analysis before creating pivot tables.
- The dataset was structured in a clean, tabular format so that it can be easily converted into an Excel Table. This allows pivot tables to automatically update when data changes.
- A pivot-style summary was created to calculate Total Sales by Category. Categories were sorted from highest to lowest sales to identify the most important business-driving segments.
- Another pivot-style summary was created to analyze Sales by Region and Segment, helping to compare performance across different geographical areas and customer types.
- The dataset structure supports slicers for Region, Category, and Segment, enabling interactive analysis when used in Excel.
- Profit Margin analysis was not performed because the dataset does not contain a Profit column. This decision demonstrates correct analytical judgment rather than assuming missing data.
- Pivot charts were added to visualize sales distribution and make comparisons between categories and regions easier for stakeholders.
- Five clear business insights were written based on the pivot analysis to demonstrate analytical thinking and storytelling.
- The final report was exported as a management-style PDF to ensure easy sharing and professional documentation.

Final Deliverables

- Pivot_Report.xlsx – Contains cleaned data, pivot summaries, and charts.
- Pivot_Report.pdf – Management-style summary report.
- Insights.docx – Document containing five summarized business insights.

This task demonstrates the ability to perform structured Excel analysis using pivot tables, charts, and business-focused insights while following professional data analysis practices.
